

Speaking Assessment · 带答案版 (七题)

每题一段完整回答，理解后用自己的话重组 — 不要背（背答案语言最多 1 分）

● 内容题 Q1–Q4

Q1 — What is your topic, and why does it matter?

My topic is skill transfer from futsal to football — how playing futsal helps young players improve at eleven-a-side football. It matters because futsal is called a "donor sport" for football. Travassos, Araújo and Davids, in a 2018 article, argue the two sports complement each other, so using futsal early could be a smart way to build skills. I wanted to test whether the evidence really supports this.

Q2 — Which skills can transfer?

A recent review by Peña-Ardila in 2026 gathers a full list. The main ones are passing, decision-making under pressure, and close control in tight spaces. The reason is simple: a futsal pitch is small and the game is fast, so players must decide and act quickly with little space.

Q3 — Is there real evidence that transfer happens?

Yes, and this is the strongest part. Oppici and colleagues, in a 2018 study, ran a real experiment — they trained futsal players with certain task constraints and found passing skill did transfer to football, with a very large effect. Peña-Ardila's 2026 meta-analysis across many studies still shows a strong overall effect, and Machado in 2024 found futsal also built decision-making in female players. So the evidence is positive — though I should say most studies are still done in controlled settings, not real matches.

最后一句 "though..." = critical voice, 4 分关键。

Q4 — How would a coach actually use this?

The key is task constraints — changing rules or pitch size to shape the skill that develops. Oppici's study shows you can design practice so that passing transfers. But there are two warnings: Nunes's 2021 study found the effect is stronger in children and weaker in older players, which is surprising; and Travassos reminds us that futsal should complement football, not replace it. I would add my own question — whether the effect differs by playing position, which nobody has tested yet.

最后亮出自己的 idea = 加分点。

追问 — Which source was most useful / informative?

The most useful was Oppici et al. 2018. It is the only experimental study — the others are reviews or coach perceptions. So it gives the strongest, most direct evidence that transfer happens, and it also shows how to design the training. That makes it useful for both my argument and my practical conclusion.

● 反思题 Q5–Q7 (Rolfe : What → So what → Now what)

Q5 — What did you find most difficult?

The most difficult part was synthesising — moving from listing studies one by one, to grouping them into themes and deciding what actually supported my argument. It took me a while to see the structure. At first I just reported each study in turn, but that felt flat, so I had to reorganise everything around three themes.

Q6 — What have you learned from the process?

The biggest lesson was how to synthesise rather than just list. I learned to group studies into themes — what transfers, the evidence, and how to train — instead of reporting them one after another. It also changed how I read: now I look for how studies relate to each other, and I check the quality of evidence, like comparing effect sizes, rather than just noting what each author said.

Q7 — What would you do differently next time?

If I did this again, I would set my inclusion criteria earlier — the rules for which papers stay or go — before I started reading. I should have done that first, because it would have saved me time. I would also build a comparison table of each study's methods from the start, to judge their quality more systematically. For my Master's project, I want to use the same theme-based approach from the beginning.

Now what 必答 ; 用 should have / If I did... I would (第三条件句) 。

● 万能句 + 红线

口头引用 : In a 2018 study, Oppici found that... (found=证据 / claimed=观点, 放信息前)

Critical voice : ...though I should say most studies are still done in controlled settings.

反思铁律 : Specific · Detailed · Thoughtful (空话=2分) | 缺 Now what 扣分

红线 : 背答案→语言最多 1 分 | 引用要报作者+年份
